FutureFunds UX/UI Training Presentation

Project Context & Users

FutureFunds' Goal:
Create a landing page that turns young professional visitors into potential clients.

Emily, 28
Financially confident
Wants transparency + planning tools

Ethan, 27
Newer to financial planning
Wants simplicity + education

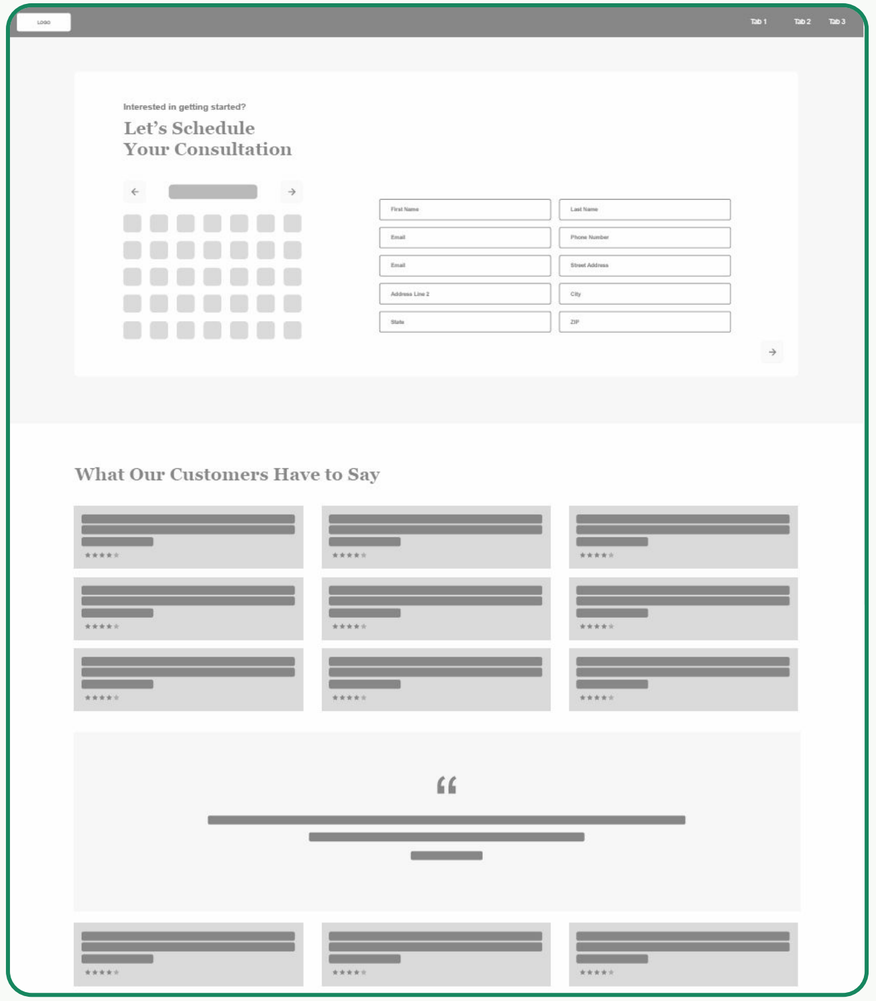

Raj, 29
Managing debt
Needs practical + empathetic guidance

Original Wireframe

Issues in the Original Wireframe:

- Crowded hero section
- Appointment scheduler appears before enough context/trust
- Weak visual hierarchy
- Financial calculator placed too low on the page
- Testimonials take up too much space
- Content feels included, but not guided

UX Principles Missing

UX Principle	Issue in Original Wireframe
User-centricity	Focused on including features, not user needs
Hierarchy	Important sections were not clearly prioritized
Context	Asked users to schedule before explaining value
Efficiency	Users had to scan too much to find useful tools
Cognitive Load	Too much information competed for attention
Consistency	Section emphasis and styling felt uneven

Redesign Goals

Communication
Make the page feel clear, trustworthy, and approachable

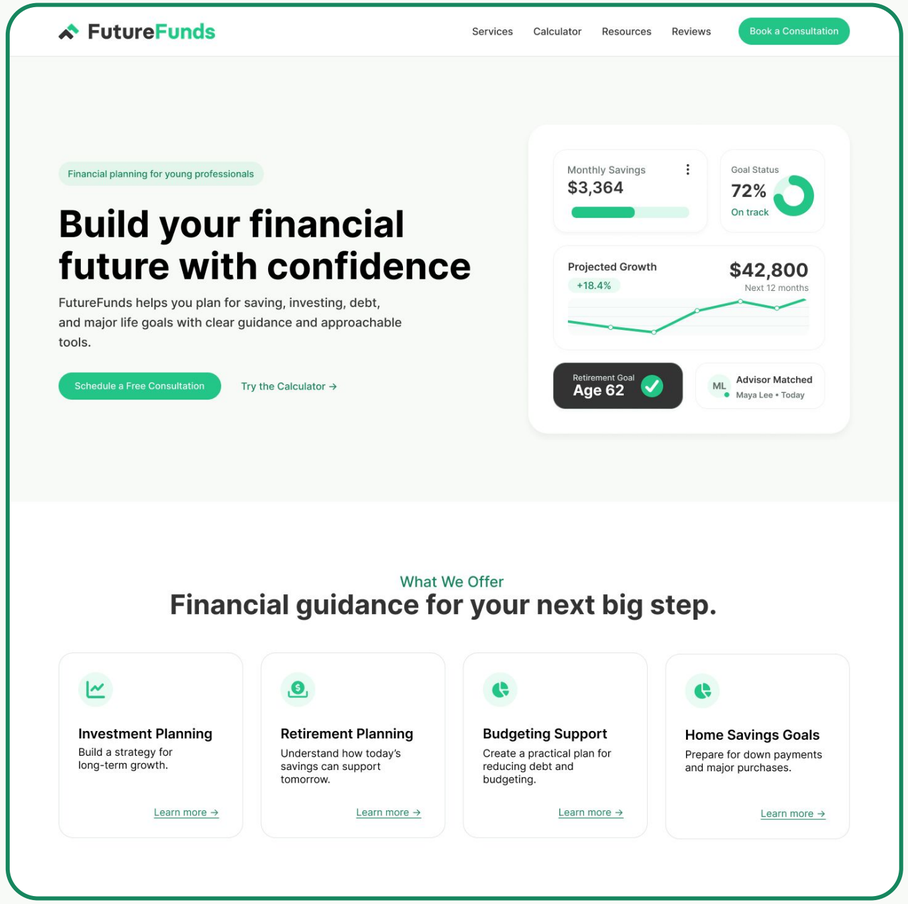

User-Centricity
Guide users from intro → services → calculator → scheduling

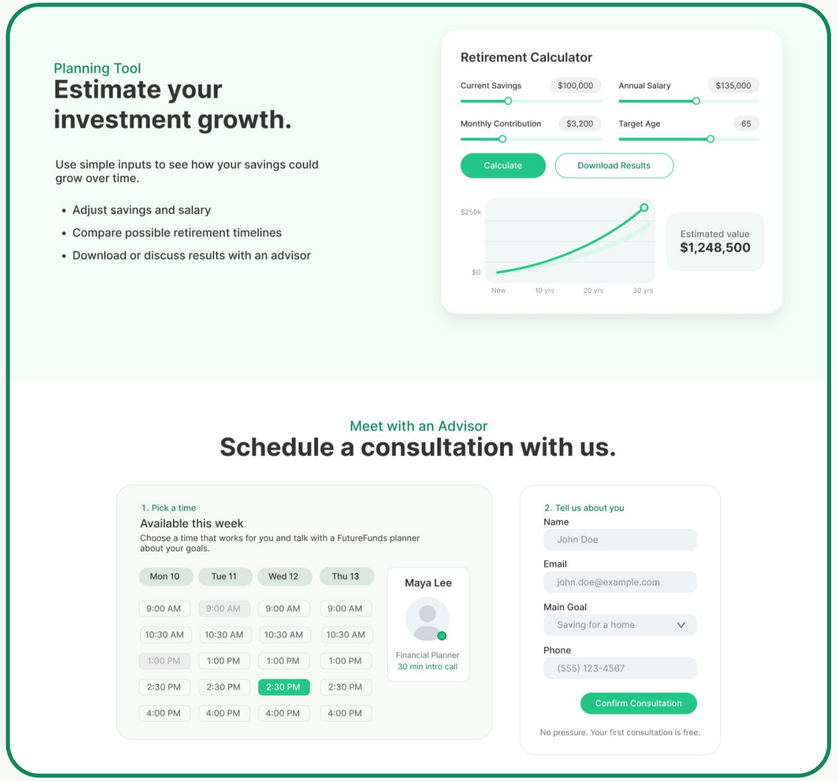

Hierarchy
Use spacing, grouping, and repetition to improve scannability

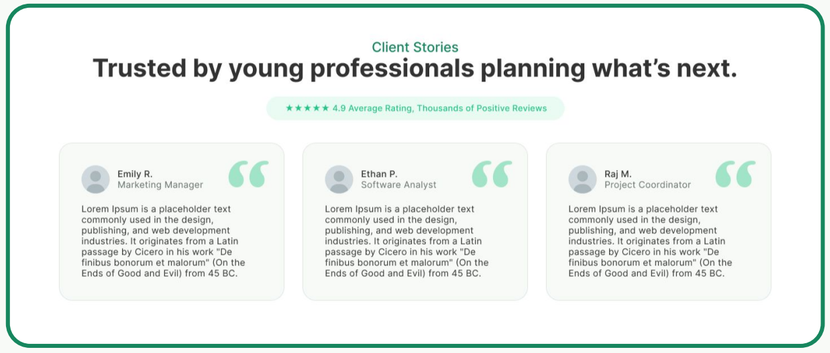

Efficiency
Highlight userful tools earlier in the experience

Consistency
Keep desktop and mobile experiences consistent

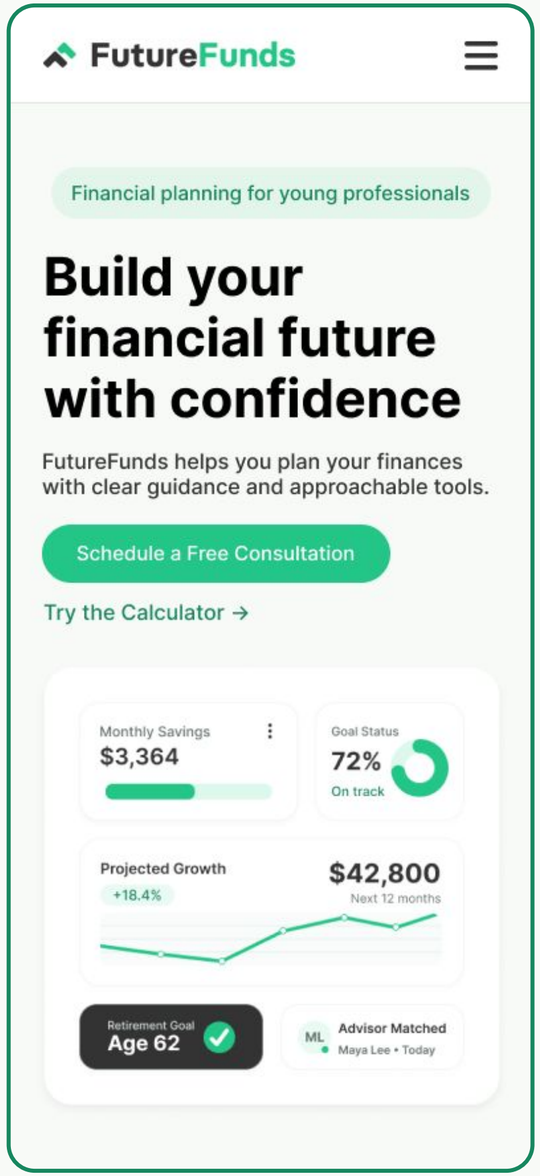

Desktop Mock-Up

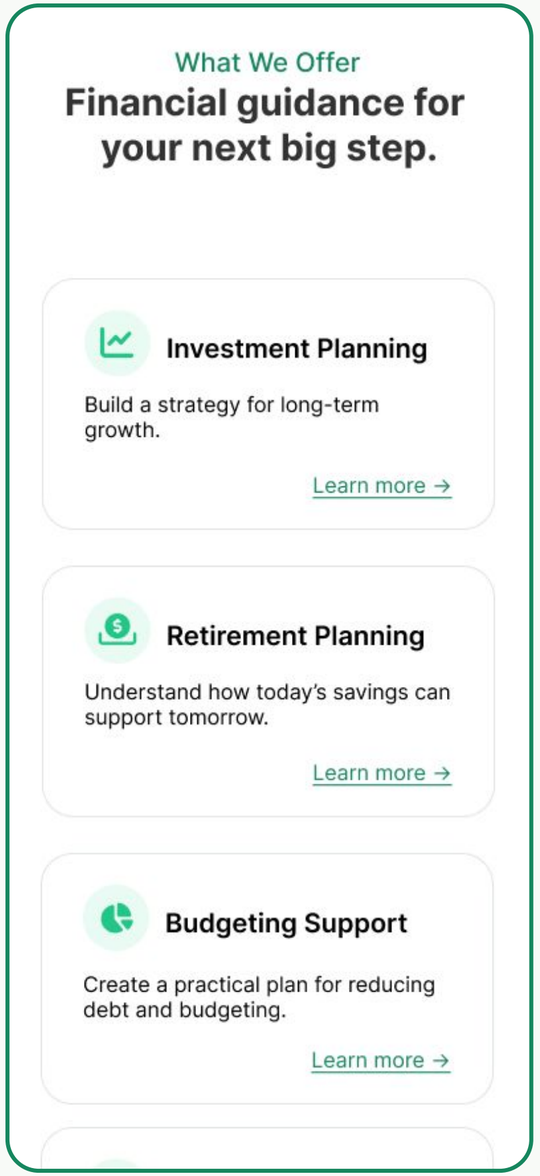

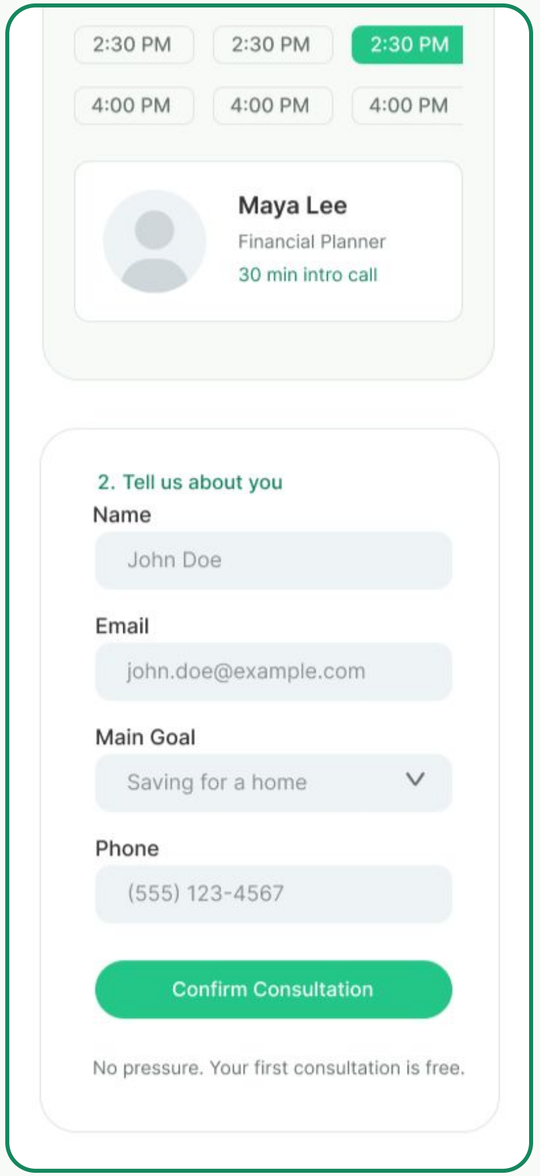

Mobile Mock-Up

Desktop vs Mobile Experience

Desktop	Mobile
Two-column layouts create visual balance	One-column layout supports focused scanning
More dashboard/detail space	Simplified cards and sections
Navigation links visible in header	Hamburger menu saves space
Calculator and scheduler have wider layouts	Inputs and buttons stack vertically
More content visible at once	Key tasks prioritized one at a time

Accessibility Standards

Buttons + Links:

- Buttons are visually distinct, with rounded shapes and green fill/borders
- Links use descriptive labels such as “Try the Calculator”

Images + Forms:

- Images support content instead of replacing text
- Form fields use visible labels and example placeholder text
- The appointment form is shorter and easier to understand

Content:

- Clear headers and subheaders organize each page section
- Body text is kept readable, with section titles for scanning
- Content does not rely on color alone. Labels, icons, text, and layout all provide meaning
- Strong contrast used between charcoal text, light backgrounds, and green accents
- Spacing between cards, sections, and form elements reduces visual clutter

Wireframe Improvements

Novice Wireframe	Revised Mock-Ups
Crowded hero section	Clear headline, value proposition, and CTA
Scheduler appears too early	Scheduler placed after services and calculator
Weak hierarchy	Stronger section order and headings
Calculator buried near bottom	Calculator highlighted earlier
Testimonials dominate page	Testimonials support trust without overpowering
High cognitive load	More spacing, grouping, and visual consistency

Feedback & Figma Use

User Feedback Theme	Design Revision
Scheduler appeared before users understood the company	Moved Scheduling after intro, services, and calculator sections
Appointment form felt too long + overwhelming	Reduced form to essential fields only
Reviews felt out of place and too prominent	Moved testimonials later as trust-building support
Cards and buttons lacked context	Added clearer titles, labels, and descriptive CTAs
Page felt cluttered and hard to process	Added more space, hierarchy, and grouped layouts
Calculator + form lacked explanation	Added section titles, labels, and support descriptions

Why Figma:

- Created high-fidelity desktop + mobile mock-ups
- Allowed visual consistency through repeated cards, buttons, and form styles
- Made it easier to revise layout, spacing, and hierarchy
- Exported designs as PNGs for presentation, or use share links for client review

Usability Test Plan

Test Scope:

- Services
- Retirement calculator
- Appointment Scheduler
- Recent blog posts
- Testimonials
- Desktop + mobile navigation

Participants:

Young professionals in their 20s or early 30s interested in saving, investing, debt management, or financial planning.

Tools:

Figma mock-ups, task list, facilitator script, note-taking form, screen recording or survey tool.

Test Tasks, Iteration & Bias

Sample Tasks:

- Identify one FutureFunds service
- Locate the calculator and explain its purpose
- Select a consultation time and find the contact form
- Find a useful blog post
- Explain whether the page feels trustworthy

Bias Mitigation:

- Use neutral wording
- Ask the same tasks in the same order
- Avoid leading questions
- Remind users this is a test of the design
- Record behavior and comments objectively

Iterative Design Value: Testing reveals confusion before development.

Conclusion

Key Takeaways:

- Start with the user problem, not just the feature list
- Use hierarchy and spacing to guide decision-making
- Design desktop and mobile experiences for their contexts
- Test with users before development
- Continue improvement through iteration

Next Steps:

- Conduct usability testing
- Analyze task success and feedback
- Revise desktop and mobile mock-ups
- Prepare designs for development handoff
